Overview

Thank you for purchasing the **Realistic Muzzle Flashes Pack**! This package provides high-quality muzzle flash effects built with **Unity Visual Effect Graph**, ready to drop on your weapons.

Usage and Customizations

Adding Muzzle Flashes to your scene:

1. Once you have **imported the package**, navigate to **Assets/DAVFX/Realistic Muzzle Flashes/URP or HDRP/Prefabs**.
2. Drag a muzzle flash prefab onto your weapon's **muzzle transform**.
3. Ensure the prefab's forward axis matches the barrel direction.
4. Trigger the VFX when the weapon fires via script with `VisualEffect.SendEvent("OnPlay")`

Customizing Muzzle Flashes

- ▶ **Firing Modes**: Use **Single Burst** when you want one clean flash per trigger. Turn it **OFF** to get **periodic bursts**, and set the spacing between bursts with **Burst Delay** (in seconds)
- ▶ Each asset exposes **many parameters** (e.g., Scale, Length, Radius, Intensity, Color, Heat Distortion, Flashes/Smoke amounts)
- ▶ All **sub-parts are modular and can be disabled** (sparks, glow, smoke, distortion, etc.) directly from the Visual Effect component.
- ▶ **VFX properties** allow you to fine-tune emissive look, color, and shape to match your scene.

Key Features

- ▶ **Custom light interaction** with Directional Light, Ambient Light, and Point Lights.
- ▶ **Advanced customization:** many exposed parameters per asset, toggle individual parts on/off.
- ▶ **Distortion Effects:** Simulates realistic heatwave effects for added depth.
- ▶ **Ready-to-Use Prefabs:** tuned for FP/TP use-cases.
- ▶ **Compatibility:** Fully compatible with Unity's URP and HDRP.

Important Settings

URP & HDRP

- ▶ Use a **Global Volume** with **Bloom** and a reasonable Exposure for proper **emissive response**.

URP Only

- ▶ Make sure to enable the "**Opaque Textures**" option inside the **Universal Render Pipeline Asset**, otherwise the initial distortion effect of the muzzle flashes will not work.

Additional Info and Common Issues

- ▶ **VFX Graph:** The **Visual Effect Graph** package must be installed via Package Manager for the effects to work properly.
- ▶ **Textures:** All **Muzzle** Flashes textures are 2048x2048.
- ▶ **Heat Distortion Issues:** If you experience problems with the heat distortion effect, try the following: Edit → VFX → **Rebuild and Save All VFX Graphs**. Sometimes simply **saving** the project, or right-clicking on the asset folder and selecting **Reimport**, is enough to **fix the issue**.
- ▶ **Demo Scene Purpose:** The included demo scene demonstrates how the muzzle flashes can be positioned and used. However, you are free to use and place the muzzle flashes differently depending on your project's needs.
- ▶ **Scaling the Effect:** To quickly adjust the **overall size** of the effect, simply scale it directly via the **Transform component**.

Performance Tips

- ▶ You can easily **reduce the texture resolution** to improve performance on low-end devices without significantly affecting visual quality.
- ▶ **Lower the number of particles** in the properties to optimize performance.
- ▶ **Disable heat distortion** if not necessary.
- ▶ Consider **disabling non-essential details** to further optimize performance. This can improve efficiency while maintaining the overall visual impact of the muzzle flashes.
